

WHAT ARE LAWNS AND LANDSCAPES GOOD FOR ANYWAY? *PLENTY.*

Protecting living landscapes in our yards, schoolyards, parks and commercial zones is critical in drought-stressed communities. Artificial and dead materials such as mulch, gravel and rocks, and plastic grass do nothing to support human, pet or wildlife health. Having the right *living* landscape for your climate zone is the answer.

GREEN SPACES ARE WILDLIFE CORRIDORS

Landscaped areas in our yards, our parks and schoolyards provide food and habitat for birds, insects, and small mammals.

BALANCE MAN-MADE ENVIRONMENTS

Green space helps offset the miles of concrete, buildings and roadways in our man-made environment, making our communities a nicer and healthier place to live.

FAMILIES AND COMMUNITIES BENEFIT

Living landscapes are critical to the health and well-being of people, pets and wildlife

GRASS-AN ENVIRONMENTAL SUPER-HERO

Grass collects, filters and cleans water, produces oxygen, absorbs carbon, reduces heat, prevents soil erosion and captures dust and particulate matter.
